Feature matrix of the clusters (level_3) — Canada national urban taxonomy
relative value per column (min–max across clusters); see feature_matrix_glossary.md for character definitions

Cluster 1
Cluster 2
Cluster 3
Cluster 4
Cluster 5
Cluster 6
Cluster 7
Cluster 8
high
middle
low
area of building
perimeter of building
courtyard area of building
circular compactness of building
squareness of building
equiv. rectangular index of building
elongation of building
number of courtyards of adjacent buildings
perimeter wall length of adjacent buildings
building adjacency (tessellation neighbourhood)
alignment of neighbouring buildings
mean distance to neighbouring buildings
mean inter-building distance
street alignment of building
connected buildings count
connected buildings area
connected buildings perimeter
connected buildings elongation
connected buildings equiv. rectangular index
connected buildings circular compactness
connected buildings longest axis length
connected buildings facade ratio
connected buildings square compactness
longest axis length of tessellation cell
area of tessellation cell
circular compactness of tessellation cell
equiv. rectangular index of tessellation cell
weighted neighbours of tessellation cell
area covered by neighbouring cells
coverage area ratio (building / cell)
building area deviation in tess. neighbourhood
length of street segment
linearity of street segment
mean segment length of street network (k=3)
buildings per metre of street segment
width of street profile
openness of street profile
width deviation of street profile
area covered by street segment
area covered by street node
mean distance to neighbouring street nodes
reached cells by neighbouring nodes (k=1)
reached area by neighbouring nodes (k=1)
local meshedness of street network (k=5)
cul-de-sac length of street network (k=3)
node density of street network (k=5)
weighted node density of street network (k=5)
proportion of dead-ends (k=5)
proportion of 3-way intersections (k=5)
proportion of 4-way intersections (k=5)
local closeness centrality of street network (k=5)
square clustering of street network
building area deviation, node-attached buildings
building height
building volume
mean canopy height (Meta CHM v2)
canopy height std.dev. (Meta CHM v2)
max canopy height (Meta CHM v2)
canopy cover fraction (Meta CHM v2)
likely occupied area (indicator)
area of largest connected structures

National production run: 152 CMAs/CAs · ~9.6M buildings · 58,684 morphotopes. Streets: OpenStreetMap (Geofabrik Canada extract). Canopy (chm_*): Meta CHM v2, aggregated in a buffer around each building.
